## Istation

# Predicting TELPAS Overall Category Rankings Using ISIPTM Reading 

Raffaela Wolf, PhD

Victoria Locke, PhD

Sean Lewis, MA

November 2022

## Executive Summary

This study provides information about the proficiency projection of Istation's Indicators of Progress (ISIP) Reading on the Texas English Language Proficiency Assessment System (TELPAS) for students in grades 2 through 5. Data for this study consists of ISIP and TELPAS scores from the 2017-2018 school year.

First, a correlational analysis was conducted to examine the Pearson productmoment associations between the TELPAS composite scale scores and the January ISIP Reading Overall scale scores. Second, a predictability study was conducted through multinomial logistic regression, where students' January ISIP Overall scale scores in reading were entered as the predictor variable and the TELPAS performance categories were the outcome variable. The purpose of this research was to predict the probability that a student would be ranked in the Advanced or Advanced High performance category.

Results show strong associations between the ISIP Reading Overall score and the TELPAS composite scale score. Correlations ranged from . 72 to .75. Results of the multinomial logistic regression also demonstrate a strong relationship between ISIP Reading scores and skills measured on the TELPAS.

Specifically, January ISIP scores that have a high probability of ranking Advanced or Advanced High on the TELPAS are similar in grades 2 and 3, and grades 4 and 5 respectively. Students in grade 2 have a high probability (greater than .66) of reaching Advanced when their ISIP score is at the $33^{\text {rd }}$ percentile, but they need to score at the $95^{\text {th }}$ percentile for a high probability of reaching Advanced High. Students in grade 3 need to score at the $14^{\text {th }}$ percentile to have a high probability of reaching Advanced and at the $76^{\text {th }}$ percentile to have a high probability of reaching Advanced High. For a high probability of reaching Advanced High, grade 4 students need to score at the $71^{\text {st }}$ percentile and grade 5 students at the $56^{\text {th }}$ percentile.

## Introduction

Istation's Indicators of Progress, or ISIPTM , is a computer-adaptive test (CAT) used to measure proficiency in both English language skills and math ability. ISIP Reading measures several subdomains of competency, including vocabulary, spelling, and reading comprehension. ISIP Reading gives overall scores as well as scores for each domain that are derived using a two-parameter logistic item response theory (2-PL IRT) model. The assessment can be given each month to monitor a student's progress and identify potential areas for improvement. Teachers use this information to adjust instruction to strengthen each student's overall ability (Mathes et al., 2016). ISIP Reading demonstrates strong correlations with other assessments such as the State of Texas Assessment of Academic Readiness (STAAR), Georgia Milestones, ACT Aspire, Ohio AIR, and the NWEA MAP (see Mathes et al., 2022 for a summary of reliability and validity of ISIP Reading).

The information provided by ISIP allows for continuously differentiated instruction and tracking growth. In 2022, the ISIP Early Reading assessment and ISIP Advanced Reading assessment were linked and placed on a common scale that ranges from 100-900. This new common scale allows for tracking growth across multiple years and comparing students from one grade level to the next. Moreover, this allows for more accurate and intuitive comparisons of ISIP with other assessments (Mathes et al., 2022).

The state of Texas uses the Texas English Language Proficiency Assessment System (TELPAS) to collect performance data to meet federal reporting requirements (Texas Education Agency, n.d.). Using the TELPAS, English learners (ELs) in kindergarten through grade 12 demonstrate their English language proficiency in four domains: listening, speaking, reading, and writing. The Texas Education Agency (TEA) requires all ELs to complete the assessment regardless of their participation in bilingual
or English-as-a-second-language programs. The TELPAS is administered each year during a window between February and May (Texas Education Agency, n.d.).

Unlike other state assessments, the TEA states, the TELPAS does not report a pass or fail score because it does not measure an EL's mastery of content. Rather, the assessment results are reported based on a proficiency continuum with four different proficiency levels: Beginning, Intermediate, Advanced, and Advanced High. Students receive an individual proficiency rating for each domain. The TEA (Texas Education Agency, n.d.) describes ELs with a Beginning proficiency rating thusly:
"Students who receive this rating are in the early stages of learning English. These students have a small vocabulary of very common words and little ability to use English in academic settings. These students often communicate using English they have memorized."

At the other end of the scale, a rating of Advanced High proficiency is described as such:
"Students who receive this rating are able to use academic English in classroom activities with little English language support from others, even when learning about unfamiliar material. Students at this level have a large enough vocabulary in English to communicate clearly and fluently in most situations."

Students in the Advanced High category are expected to be as proficient as native English speakers.

According to the TEA, students in grades 2 through 12 take an online assessment to measure their proficiency in listening, speaking, and reading. However, the writing portion of the assessment is rated holistically using trained individuals as raters. English learners in kindergarten and grade 1 are assessed holistically for all of the domains. The

ISIP $^{\text {TM }}$ and TELPAS
proficiency ratings for these early grades include observational assessments completed by trained raters.

In addition to the individual domain scores, a composite score is calculated and reported (Texas Education Agency, n.d). In order to use the individual domain scores in the composite score, the domain rating is converted to a numerical scale ranging from 1 for Beginning to 4 for Advanced High. Each domain score is given an equal weight of $25 \%$ of the composite score. The domain score is then multiplied by the weight, and the four weighted scores are added together to determine the composite rating. A composite score of 3.5 or higher is considered Advanced High, 2.5 to 3.4 is Advanced, 2.4 to 1.5 is Intermediate, and below 1.5 is Beginning (Texas Education Agency, n.d.).

The TELPAS shows reliability with other assessments. In a sample of second grade students, the TELPAS score correlated with the State of Texas Assessment of Academic Readiness (STAAR) assessment at . 61 (Villicana-Briseno, 2020). Correlations for TELPAS with the Texas Assessment of Knowledge and Skills (TEKS) assessment ranged from .74 for third graders to .65 for fifth graders and .55 for eighth graders (Badgett et al., 2012).

In this study we sought to examine the relationship between ISIP Reading and the TELPAS composite rating. Using data from a large, urban school district in north Texas, we evaluated the probability of a student reaching each category on the TELPAS based on their middle-of-the-year ISIP score. This information should allow teachers and administrators to estimate how a student will perform on the TELPAS given their performance on ISIP. This study is important as the TELPAS is a high-stakes assessment that is part of the school accountability system in Texas, and it impacts a school's ability to meet federal and state targets for EL students (Collier \& Huang, 2019).

## Data and Methods

We obtained data in partnership with a large urban school district for this study. The data consisted of ISIP and TELPAS scores for the 2017-2018 school year as well as student demographics. Istation implemented a vertical scale in 2022 with updated norms based on a sample from the 2018-2019 school year. We first applied the vertical scale to the ISIP Reading scores and then applied the new norms to this data set, so the scores used in the calculations below are based on the most recent norms.

We examined the Pearson product-moment correlation between the TELPAS composite scale score and the January ISIP Reading Overall scale score for each grade. We then conducted a simple multinomial regression analysis using the January ISIP Reading Overall score to predict TELPAS composite ratings. The sample consisted of students who had an ISIP Reading score, meaning their teachers had determined that the students' English skills were proficient enough for them to take ISIP Reading. The school district that shared the data for this study stated that students who are not ready to take ISIP Reading do not take that assessment. Therefore, the sample is not representative of all EL students, but rather it is representative of those who have relatively higher English language proficiency.

## Sample Description

For this study, we examined students in grades 2 through 5. Prior to grade 2, student composite ratings on the TELPAS are assigned through a teacher rating. Above grade 5, the sample was insufficient to conduct a meaningful analysis. This was due to both a small sample size and a more strongly skewed sample in grade 6 that prevented meaningful inference. All students in the sample were identified as ELs. Virtually all students in this sample were at least ranked in the Intermediate TELPAS category. This is likely because the school district ensures that students who are not prepared to take

ISIP Reading do not do so. Instead, those students whose English skills are below this threshold typically take ISIP Lectura, Istation's Spanish-language literacy assessment.

The grade 2 sample consisted of $93.69 \%$ of students that were of Hispanic origin. Grade 3 students were $92.93 \%$ of Hispanic origin, $92.02 \%$ of students in grade 4, and $93.52 \%$ of students in grade 5 were of Hispanic origin. Less than $3 \%$ of the sample consisted of students who were non-Hispanic White, less than $5 \%$ were non-Hispanic Black, and less than $4 \%$ were Others, such as students of Asian origin or multi-race. The gender makeup was approximately $49 \%$ female and $51 \%$ male in grades 2 and 3 , and there were slightly fewer females in grades 4 and 5 . These results are summarized in Table 1.

We eliminated outlier scores from the sample by excluding ISIP scores below the $1^{\text {st }}$ percentile or above the $99^{\text {th }}$ percentile. The counts in the table below reflect the final analytic sample. Means and standard deviations by grade for ISIP Reading and TELPAS are available in Table 2.

Table 1.
Sample Demographics by Race/Ethnicity and Gender

| Grade | N | Non- <br> Hispanic <br> Black | Hispanic <br> Any Race | Non- <br> Hispanic <br> White | Non- <br> Hispanic <br> Asian / <br> Others | Female | Male |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{2}$ | 3218 | $<1 \%$ | $93.69 \%$ | $<1 \%$ | $5.27 \%$ | $48.2 \%$ | $51.8 \%$ |
| $\mathbf{3}$ | 2052 | $0 \%$ | $92.93 \%$ | $1.39 \%$ | $5.71 \%$ | $49.0 \%$ | $51.0 \%$ |
| $\mathbf{4}$ | 1491 | $0 \%$ | $92.02 \%$ | $1.54 \%$ | $6.44 \%$ | $46.0 \%$ | $54.0 \%$ |
| $\mathbf{5}$ | 1575 | $0 \%$ | $93.52 \%$ | $1.33 \%$ | $5.15 \%$ | $47.6 \%$ | $52.4 \%$ |

ISIP $^{\mathrm{TM}}$ and TELPAS

## Table 2.

Means and Standard Deviations for ISIP Reading January Scores and TELPAS Scores

| Grade | $\mathbf{N}$ | ISIP Reading <br> Mean (SD) | TELPAS <br> Mean (SD) |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{2}$ | 3218 | $367.34(60.07)$ | $1496(72.98)$ |
| $\mathbf{3}$ | 2052 | $410.92(63.28)$ | $1532(100.76)$ |
| $\mathbf{4}$ | 1491 | $459.69(58.54)$ | $1537(85.34)$ |
| $\mathbf{5}$ | 1575 | $490.43(60.54)$ | $1581(98.86)$ |

## Predictive Models

For this study, we used a student's January ISIP Reading Overall scale score to predict the probability that the student would be ranked in the Advanced or Advanced High categories. We first calculated the relationship between ISIP Reading and TELPAS with Pearson product-moment correlations. Next, to model the probabilities, we used a multinomial logistic regression model, employing the "multinom" function from the $R$ package "nnet."

Using the parameters derived from this analysis, we generated tables showing the probability of landing in Advanced and Advanced High at each percentile rank score. Values that are less than $33 \%$ probabilities are categorized as a student having a low probability of achieving a TELPAS level. Students had a medium probability of achieving a TELPAS level if the probabilities were $33 \%$ to $66.69 \%$ and a high probability at or above $67 \%$. These results are summarized in tables 4 through 7 .

## Results

The data clearly show a strong correlation between the ISIP Reading Overall score and the TELPAS composite score. The correlations range from .72 to .75 . This indicates a high level of predictability of TELPAS composite scores given the ISIP Reading score in January, with 52 to $56 \%$ of the variability in the TELPAS score
attributable to factors measured in the ISIP Reading Overall score. These results are summarized in Table 3.

Table 3.

TELPAS Composite Score Scale and January ISIP Overall Score Correlations by Grade

| Grade | Pearson r |
| :---: | :---: |
| $\mathbf{2}$ | .73 |
| $\mathbf{3}$ | .72 |
| $\mathbf{4}$ | .75 |
| $\mathbf{5}$ | .75 |

The results of the multinomial logistic regression are available in tables 4 through 7. Most notable is the discrepancy between the percentile ranks needed to have a high probability of reaching the Advanced category versus Advanced High. Students in grade 2 have a high probability of reaching Advanced at the 34th percentile, but they need to be at the 95th percentile to have a high probability of meeting Advanced High. In grade 3 , students have a high probability of reaching Advanced at the 14th percentile, and they need to be at the 76th percentile to have a high probability of reaching Advanced High. In grade 4, students at the 15 th percentile have a high probability of reaching the Advanced category and need to be at the 71st percentile to reach Advanced High. In grade 5, students have a high probability of reaching Advanced at the 9th percentile, and they need to be at the 56th percentile to have a high probability of reaching Advanced High.

Table 4.
Grade 2 Probability of Advanced or Advanced High and Category Ranking by January ISIP Percentile

## Discussion

These results demonstrate that ISIP scores can be used to predict student performance on the end-of-year TELPAS assessment. This gives critical information to educators and administrators and allows for customized solutions, as ISIP gives domain-specific information about a student's performance. These results show that students need to have a high level of proficiency in English to reach the Advanced High category on the TELPAS. For example, grade 2 students at the 23rd percentile on ISIP Reading will have a probability of .51 of reaching Advanced, but to have a greater than .50 probability for Advanced High, they need to be at or above the 89th percentile. Students in grade 3 have a . 50 probability of reaching Advanced at the $8^{\text {th }}$ percentile but need to be at the 61 st percentile to have a .50 or greater probability of reaching Advanced High. This demonstrates that the state of Texas set a high bar of performance for students to reach the Advanced High category of language proficiency.

Teachers can use the information provided by ISIP to strengthen a student's ability in areas where they need more support. Additionally, the Istation curriculum can be used to address these areas. Our previous research shows that time spent using the Istation computer adaptive curriculum in Spanish and English can improve student performance on the TELPAS (Locke et al., 2022).

## Limitations

While this study does confirm a strong relationship between the TELPAS and ISIP Reading scores, it is unclear to what extent these results may generalize to other school districts. Typically, beginning English learners do not take ISIP Reading in this school district, which skewed the sample toward already higher performing students. Further, these data came from a large urban school district. Relationships between the TELPAS and ISIP may differ in other settings, such as more rural districts. However, the effects demonstrated in this study are large and significant, so while the strength of the
relationship between TELPAS and ISIP scores may weaken in other settings, ISIP should still have some ability to predict TELPAS performance. Finally, these data are from the 2017-2018 school year, and the relationship between these two assessments may differ in post-pandemic settings.

## Future considerations

A more thorough sample of Texas districts and students would produce a better understanding of the predictive power of ISIP for TELPAS scores. More research is needed to examine the relationship between these assessments in rural and suburban school districts. This would provide a more complete, robust, and reliable picture of the utility of ISIP in predicting TELPAS scores. Moreover, data collected from after the pandemic could and should be used to show differences in student performance in both ISIP and TELPAS. Our previous research has shown that students who used Istation in the spring of 2020 had significantly less COVID-related learning loss than students who did not (Lewis et al., 2020). This research should be extended to determine whether Istation's curriculum and assessment tools help foster learning recovery in students adversely impacted by the pandemic.
